

ELEMENTS OF CONSTRUCT IN AGRICULTURE

The elements of construct are like a summary of what the graduate of the programme will look like. They are like the terminal integrated competencies that the student should have acquired at the end of the course. For agriculture, the student is expected to be able to grow crops and rear animals profitably and sustainably. He should therefore be able to handle and use money wisely, work with others and add value to his products. Because the profile is wide, it is broken down into 4 parts that give rise to the 4 sections in the paper.

The first element is therefore on value addition, safe keeping and proper use of money and working together in groups. That forms compulsory question number 1.

The only caveat here is that value addition begins after harvest. Therefore washing, drying etc constitute value addition.

The second element combines soil and land. Soil formation, properties, constituents, fertility, conservation and land tenure, reform etc

The **last two** are **crop production** and **animal production**. The tools relevant to a section go with the section e.g garden tools go with crop while animal handling tools go with animals. Also the relevant structures go with the section e.g. stores with crop and animal houses with animals
